USED SPARK PLUG GASKETS

Are you "penny wise and pound foolish"?

Do you reuse distorted, beat up spark plug gaskets either "as is" or after a quick straightening-out process? Why?

You and your customer expect the best in spark plug performance after you have gone to the trouble, time, and expense of inspecting and/or overhauling spark plugs. Why try to save a nickel on a gasket when you want perfect performance from an engine worth several thousand dollars?

All plug manufacturers insist on high standards of quality from their gasket suppliers. This is to ensure that the spark plug will seal properly in the bushing so that

- (1) Combustion gas leakage will not occur,
- (2) Spark plugs will not loosen in service, and
- (3) Plugs will not seize because the threads have filled with contaminant.

. . . . and so why take these chances by reusing an old gasket when new ones are so relatively inexpensive?
