Inspection (of) Oil Filters

Before installing a full flow spin-on oil filter or a cartridge type element a few basic inspection procedures should be completed.

- Look at the general appearance for possible shipping damage.
- Check the sealing gasket and mounting surfaces for damage.
- Inspect the threaded stud on the CH 48110 or CH 48111 filter for machining burrs or silvers on the ID surface.

“See Diagram”

- Is the part number application correct?
- Install filter per installation instructions printed on the filter body.

Additionally, after the filter is removed use the Champion Ct-470 oil filter can cutter to cut open and inspect the media.
