98-1AA

Champion Aviation Technical Bulletin 97-8 has raised numerous inquiries concerning DC-200 product used on the Champion harness.

First of all...**NO LUBRICANT SHOULD EVER BE NEEDED! CHAMPION AVIATION RECOMMENDS A DRY INSTALLATION.**

Secondly, a correction is in order. We were informed many years ago that DC-200 was okay to use on silicone parts. Recently we have learned that DC-200, as well as DC-4, can cause deterioration of the insulator tips of Champion harnesses.

For the technicians who insist on using a lube, please stand by!! Champion Aviation is in the process of testing many new products for this purpose. But, for the present we recommend you **STOP** using DC-200 & DC-4 for lubrication of Champion harnesses.
