SUBJECT: Spark Plug Installation TBFYI-99-2

Every time you install new spark plugs, the following procedure should ALWAYS be followed:

Look at the overall appearance of the spark plug.

- √ The connector well for any abnormalities.
- √ The firing end for foreign material lodged between electrodes or around the insulator that could be conductive.
- √ The electrode gap. Is gap set between .016 - .021 as the manufacturer recommends?

You are now ready for installation. Don't forget a small amount of antiseize and a new gasket. Plus...follow the manufacturer's recommended installation torque.

Should any questions arise from your inspection, feel free to contact our Product Support Department @ 864/843-5400 or support@championaerospace.com
